Mission Statement:

Searching for a cyber security position at Variant Solutions that values excellent attention to detail and requires a highly motivated, skilled, and driven individual that desires to learn. Customer centric attitude and seeking to grow through challenging work in a team environment.

Skills

- CompTIA Security+ SY0-501 Certified
- Strong scripting experience (Python, Bash, PHP, etc)
- Border Gateway & Shortest Path First Protocols
- Deep knowledge of networks: TCP/IP, DNS, DMZs, etc
- Expert C, C++, & Python programmer
- Strong Linux system administration
- Very bright & fast learner, good team work skills
- Solid writing, communication & presentation experience

Education

- **Metropolitan State University of Denver**
 - B.Sc., Computer Science & Applied Mathematics Double Major – Honors Program (3.88 GPA)
 - Computer Networks, Penetration Testing & Defense
 - Previous president of the ACM & SIAM student chapters
- **CompTIA Security+ SY0-501 Certified** (Expires February 2022)
- **OSCP Certification In Training**

Work Experience

- **University of Denver – Cybersecurity Teaching Assistant (Part Time)** **Present**
 - Packet analysis, Wireshark, SIEMs
 - Task automation with scripts & cronjobs
 - Networking protocols, OSI model, TCP/IP
 - Windows & Linux system administration techniques
 - System hardening, secure web technology architecture
 - Secure network design, DMZs, ACLs
 - Ethical hacking & penetration testing
 - Programming with Python & Bash scripting
 - Risk management & vulnerability assessment
 - Router & switch configuration, ARP poisoning

Academic Projects

- **CPU Scheduler**
 - I wrote a lightweight kernel that round robins through executables given as command line arguments in C++. I am also an expert C programmer, with more than three years of experience. C is my favorite programming language, and I am very familiar with typical C idioms. I tend to use a fairly object-oriented style, with structs representing objects and consistently named functions that operate on them. I like the K&R brace style. I read and worked all the exercises in the book “The C Programming Language”. I can write excellent C code with confidence, and have no problem reading and understanding C++. For this project all system calls are asserted, plus static and dynamic analysis was done with scan-build and valgrind, respectively. No warnings are generated, and no memory leakage.
- **Network Traffic Classifier**
 - I have a large passion to combine machine learning and cyber security. I am building a neural network in Python using Tensorflow to classify nefarious network traffic. I obtained packet capture (PCAP) files from pentesting in my virtual lab and cleaned them for training and testing data. I decided on a CNN architecture to extract meaningful features, then feeding the plain-text payloads (if any detected) into an LSTM autoencoder to analyze character by character. This research was conducted out of my own will and was an entirely independent project.
